**SKU:** PA-10801 2-H

## PRODUCT DESCRIPTION

### Purpose & Benefits of Plastalume Finger Splints - Frogs

Plastalume Finger Splints in the "Frogs" design are specialized orthopedic devices used to stabilize and immobilize the fingers following injuries such as fractures, dislocations, or sprains. These splints are particularly effective in securing the finger in a fixed position, promoting proper alignment and aiding the healing process. The "Frog" shape of the splint is designed to provide a snug and comfortable fit around the finger, offering excellent support while preventing further injury or movement that could disrupt recovery.

### Features

- **Ergonomic Design:** The unique "Frog" shape conforms to the natural curvature of the finger, providing a comfortable fit and effective immobilization.
- **Rigid Support:** Constructed from durable materials that maintain the integrity of the splint, ensuring the finger remains in the desired position during the healing process.
- **Padded Interior:** Features a foam or soft padding on the inside, reducing the risk of skin irritation and increasing comfort for prolonged wear.
- **Adjustable Straps:** Comes equipped with adjustable straps or closures that secure the splint in place, allowing for adjustments as needed for swelling or comfort.
- **Easy Application and Removal:** Designed for ease of use, allowing patients or healthcare providers to apply and remove the splint without additional assistance.

### Specifications

- **Material:** Typically made from a strong plastic or metal exterior for rigidity, lined with foam or a soft material for comfort.

- **Size:** Small, Medium, Large
